- Higher-order equations.

- In first order unification, we were not allowed to replace a variable with a function.
- ▶ However, it makes sense to ask to find, e.g., a function that when applied to an object gives again this object: Find an F such that F(a) = a.
- ► *F*: Higher-order variable, appears at functional position.
- Can be solved, e.g., with the identity function or with the constant function a.
- Higher-order equations.
- Solving method: Higher-order unification.

- Higher-order unification is fundamental in automating higher-order reasoning.
- Used in logical frameworks, logic programming, program synthesis, program transformation, type inferencing, computational linguistics, etc.
- Much more complicated than first-order unification (undecidable, of type zero, nonterminating, . . .).
- ▶ In this lecture: Introduction to higher-order unification.

# **Outline**

Introduction

**Preliminaries** 

Higher-Order Unification Procedure

# Simply Typed $\lambda$ -Calculus

- ▶ Simply type  $\lambda$ -calculus is our term language.
- ▶ In this section: Definitions and elementary properties.
  - Types
  - Terms
  - Substitutions
  - Reduction
  - Unification

# **Types**

# Types

Consider a finite set whose elements are called *atomic types* (or *base types*). Then:

- Atomic types are types,
- ▶ If T and U are types than  $T \rightarrow U$  is a type.

The expression  $T_1 \to T_2 \to \cdots \to T_n \to U$  is a notation for the type  $T_1 \to (T_2 \to \cdots \to (T_n \to U) \ldots)$ .

# **Types**

# Order of a Type

- ightharpoonup o(T) = 1 if T is atomic.
- ▶  $o(T \to U) = max\{1 + o(T), o(U)\}.$

# Example

Let  $T_1$ ,  $T_2$ ,  $T_3$  be atomic types, then

- ▶  $o(T_1 \to T_2 \to T_3) = 2$ .
- ▶  $o((T_1 \to T_2) \to T_3) = 3.$

#### **Terms**

#### Assumptions:

- Consider finite set of constants.
- To each constant a type is assigned.
- For each atomic type there is at least one constant.
- For each type there is an infinite set of variables.
- Two different types have disjoint sets of variables.

#### $\lambda$ -Terms

- Constants are terms.
- Variables are terms.
- ▶ If t and s are terms then (t s) is a term.
- If x is a variable and t is a term then  $\lambda x$ . t is a term.

The expression  $(t s_1 \ldots s_n)$  is a notation for the term  $(\ldots (t s_1) \ldots s_n)$ 

### **Terms**

- ▶  $\lambda x. t$  is a function where  $\lambda x$  is the  $\lambda$ -abstraction and t is the body. Intuitively, it is a function  $x \mapsto t$ .
- In  $\lambda x$ . t,  $\lambda x$  is a binder for x in t. Occurrences of x in t are bound.
- ▶ (*t s*) is an application where function *t* is applied to the argument *s*.

### **Terms**

# Type of a Term

A term t is said to have the type T if either

- ▶ t is a constant of type T,
- ▶ t is a variable of type T,
- ▶ t = (r s), r has type  $U \rightarrow T$  and s has type U for some U,
- ▶  $t = \lambda x$ . s, the variable x has type U, the term s has type V and  $T = U \rightarrow V$ .
- A term t is said to be well-typed if there exists a type T such that t has type T.
- ▶ In this case T is unique and it is called the type of t.
- We consider only well-typed terms.

# Order

# Order of a Symbol, Language

- The order of a function symbol or a variable is the order of its type.
- A language of order n is one which allows function symbols of order at most n + 1 and variables of order at most n.

#### Formalization of the conventions:

- First order term denotes an individual.
- Second order term denotes a function on individuals.
- etc.

# Free Variables

- ▶ vars(t): The set of variables occurring in the term t.
- An occurrence of a variable in a term is free if it is not bound.
- ► The set of variables that occur freely in t, denoted fvars(t):
  - $fvars(c) = \emptyset$ , where c is a constant.
  - $fvars(x) = \{x\}.$
  - $fvars((sr)) = fvars(s) \cup fvars(r)$ .
  - $fvars(\lambda x. s) = fvars(s) \setminus \{x\}.$
- Closed term: A term without free variables.

# Free Variables

# Example

- $fvars(\lambda x. x) = \emptyset$ . (Closed term)
- $fvars(\lambda x. y) = \{y\}.$
- fvars(((\(\lambda x. x)\) x)) = {x}. (x has a bound occurrence as well)

# Substitution

- We reuse the definition of substitution as finite mapping from the previous lectures, but in addition require that it preserves types.
- ► Hence, if x → t is a binding of a substitution, x and t have the same type.
- ► The definitions of composition, more general substitution, etc. will also be reused.

# Replacement in a Term

# Replacement in a Term

Let  $\sigma = \{x_1 \mapsto t_1, \dots, x_n \mapsto t_n\}$  be a substitution and t be a term, then the term  $t\langle \sigma \rangle$  is defined as follows:

- $ightharpoonup c\langle \sigma \rangle = c.$
- $ightharpoonup x_i \langle \sigma \rangle = t_i.$
- $(sr)\langle \sigma \rangle = (s\langle \sigma \rangle r \langle \sigma \rangle).$
- $(\lambda x. s) \langle \sigma \rangle = (\lambda x. s \langle \sigma \rangle).$

# Example

- $(\lambda x. x) \langle \{x \mapsto y\} \rangle = \lambda x. y.$
- ▶  $(\lambda y. x)\langle \{x \mapsto y\}\rangle = \lambda y. y$  (variable capture).

# $\alpha$ -Equivalence

# $\alpha$ -Equivalence

- $ightharpoonup c \equiv_{\alpha} c$ .
- $\triangleright$   $X \equiv_{\alpha} X$ .
- $ightharpoonup (t s) \equiv_{\alpha} (t' s') \text{ if } t \equiv_{\alpha} t' \text{ and } s \equiv_{\alpha} s'.$
- ▶  $\lambda x. t \equiv_{\alpha} \lambda y. s$  if  $t\langle \{x \mapsto z\} \rangle \equiv_{\alpha} s\langle \{y \mapsto z\} \rangle$  for some variable z different from x and y and occurring neither in t nor in s.

# Example

- $\triangleright \lambda x. x \equiv_{\alpha} \lambda y. y.$
- $ightharpoonup \alpha$ -equivalence is an equivalence relation.
- Application and abstraction are compatible with  $\alpha$ -equivalence.

### Substitution in a Term

#### Substitution in a Term

Let  $\sigma = \{x_1 \mapsto t_1, \dots, x_n \mapsto t_n\}$  be a substitution and t be a term, then the term  $t\sigma$  is defined as follows:

- $ightharpoonup c\sigma = c.$
- $ightharpoonup x_i \sigma = t_i.$
- $\triangleright$   $x\sigma = x$ , if  $x \notin \{x_1, \ldots, x_n\}$ .
- $(sr)\sigma = (s\sigma r\sigma).$
- ▶  $(\lambda x. s)\sigma = (\lambda y. s\{x \mapsto y\}\sigma)$ , where y is a fresh variable of the same type as x.

Since the choice of fresh variable is arbitrary, the substitution operation is defined on  $\alpha$ -equivalence classes.

# Substitution in a Term

# Example

- $(\lambda x. x)\{x \mapsto y\} = \lambda z. z.$
- ▶  $(\lambda y. x)\{x \mapsto y\} = \lambda z. y$  (no variable capture).
- $(x \lambda x. (x y)) \{x \mapsto \lambda z.z\} = (\lambda z.z \ \lambda u. (u y)).$

- Intuition: Function evaluation.
- ► For instance, evaluating function  $f: x \mapsto x + 1$  at 2: f(2) = 2 + 1.
- ► As  $\lambda$ -terms:  $((\lambda x. x + 1) \ 2) \triangleright x + 1\{x \mapsto 2\} = 2 + 1$ .  $(\beta$ -reduction)

# Formally:

# $\beta\eta$ -Reduction

- ▶  $\beta$ -reduction:  $((\lambda x.s) t) \triangleright s\{x \mapsto t\}$ .
- ▶  $\eta$ -reduction:  $(\lambda x.(t x)) \triangleright t$ , if  $x \notin fvars(t)$ .

#### Propagates into contexts:

- ▶ If  $s \triangleright s'$  then  $(s t) \triangleright (s' t)$ .
- ▶ If  $t \triangleright t'$  then  $(st) \triangleright (st')$ .
- ▶ If  $t \triangleright t'$  then  $\lambda x. t \triangleright \lambda x. t'$ .

 $\triangleright^*$  - reflexive-transitive closure of  $\triangleright$ .

#### Facts:

- $\beta\eta$ -Reduction preserves types.
- ▶ If  $s \triangleright^* t$  then  $s\sigma \triangleright^* t\sigma$ .
- ► Each term has a unique  $\beta\eta$ -normal form modulo  $\alpha$ -equivalence.

# Example

$$\lambda x.(f((\lambda y.(y x)) \lambda z.z)) \rhd_{\beta} \lambda x.(f((\lambda z.z) x))$$
$$\rhd_{\beta} \lambda x.(f x)$$
$$\rhd_{\eta} f$$

# Long Normal Form

#### Assume

- $t = \lambda x_1 \dots \lambda x_m \cdot (r s_1 \dots s_k)$  is in the  $\beta \eta$ -normal form,
- ▶  $T_1 \rightarrow \cdots \rightarrow T_n \rightarrow U$  is a type of t,
- ▶ U is atomic and  $n \ge m$ .

Then the long normal form of t is the term

$$t' = \lambda x_1 \dots \lambda x_m . \lambda x_{m+1} \dots \lambda x_n . (r s'_1 \dots s'_k x'_{m+1} \dots x'_n)$$

#### where

- $\triangleright$   $s'_i$  is the long normal form of  $s_i$ .
- $\triangleright$   $x_i'$  is the long normal form of  $x_i$ .

# Long Normal Form

#### Assume

- $t = \lambda x_1 \dots \lambda x_m \cdot (r s_1 \dots s_k)$  is in the  $\beta \eta$ -normal form,
- ▶  $T_1 \rightarrow \cdots \rightarrow T_n \rightarrow U$  is a type of t,
- ▶ U is atomic and  $n \ge m$ .

Then the long normal form of t is the term

$$t' = \lambda x_1 \dots \lambda x_m . \lambda x_{m+1} \dots \lambda x_n . (r s'_1 \dots s'_k x'_{m+1} \dots x'_n)$$

#### where

- $\triangleright$   $s'_i$  is the long normal form of  $s_i$ .
- $\triangleright$   $x_i'$  is the long normal form of  $x_i$ .

The long normal form of any term is that of its normal form.

# Long Normal Form

#### Assume

- $t = \lambda x_1 \dots \lambda x_m$ .  $(r s_1 \dots s_k)$  is in the  $\beta \eta$ -normal form,
- ▶  $T_1 \rightarrow \cdots \rightarrow T_n \rightarrow U$  is a type of t,
- ▶ U is atomic and  $n \ge m$ .

Then the long normal form of t is the term

$$t' = \lambda x_1 \dots \lambda x_m . \lambda x_{m+1} \dots \lambda x_n . (r s'_1 \dots s'_k x'_{m+1} \dots x'_n)$$

#### where

- $\triangleright$   $s'_i$  is the long normal form of  $s_i$ .
- $\triangleright$   $x_i'$  is the long normal form of  $x_i$ .

The long normal form of any term is that of its normal form.

Since t is in the normal form, r (called the *head* of t) is either a constant or a variable.

# Example

Let the type of f be  $T_1 \rightarrow T_2 \rightarrow U$ , with U atomic. Let t be  $\lambda x.(f((\lambda y.(y x)) \lambda z.z))$ .

# Example

Let the type of f be  $T_1 \rightarrow T_2 \rightarrow U$ , with U atomic. Let f be  $\lambda x.(f((\lambda y.(y x)) \lambda z.z))$ .

▶ The long normal form of t is  $\lambda x.\lambda y.(f \times y)$ .

# Example

Let the type of f be  $T_1 \to T_2 \to U$ , with U atomic. Let t be  $\lambda x.(f((\lambda y.(y x)) \lambda z.z))$ .

- ▶ The long normal form of t is  $\lambda x.\lambda y.(f x y)$ .
- $\triangleright$   $\lambda x.\lambda y.(f x y)$  is a long normal form of  $\lambda x.(f x)$  as well, which is a  $\beta$ -normal form of t.

# Example

Let the type of f be  $T_1 \to T_2 \to U$ , with U atomic. Let t be  $\lambda x.(f((\lambda y.(y x)) \lambda z.z))$ .

- ▶ The long normal form of t is  $\lambda x.\lambda y.(f \times y)$ .
- $\lambda x.\lambda y.(f x y)$  is a long normal form of  $\lambda x.(f x)$  as well, which is a β-normal form of t.
- ▶ In general, to compute long normal form, it is not necessary to perform  $\eta$ -reductions.

# Long Normal Form

- ▶ In the rest, "normal form" stands for "long normal form".
- Notation: We write

$$\lambda x_1 \ldots \lambda x_n . r(t_1, \ldots, t_m)$$

for

$$\lambda x_1 \dots \lambda x_n$$
.  $(r t_1 \dots t_m)$ 

in normal form. *r* is either a constant or a variable.

### Complete Set of Unifiers

▶ A substitution  $\sigma$  is more general on a set of variables  $\mathcal{X}$  than  $\vartheta$ , written  $\sigma \leq^{\mathcal{X}} \vartheta$ , if there exists  $\psi$  such that  $x\sigma\psi \doteq x\vartheta$  for all  $x\in\mathcal{X}$  (modulo  $\beta\eta$ -reduction).

#### Complete Sets of Unifiers

- ightharpoonup C is a *complete set of unifiers* of a unification problem  $\Gamma$  iff
  - 1. C's elements are unifiers of  $\Gamma$ , and
  - 2. For each unifier of  $\Gamma$ ,  $\vartheta$ , there exists  $\sigma \in \mathcal{C}$  such that  $\sigma \leq^{\mathcal{X}} \vartheta$ , where  $\mathcal{X} = \textit{fvars}(\Gamma)$ .
- C is a minimal complete set of unifiers of Γ if it is a complete set of unifiers of Γ and
  - 3. two distinct elements of  $\mathcal{C}$  are not comparable wrt  $\leq^{\mathcal{X}}$ .

Higher-Order Unification Procedure

### Higher-Order Unification Problem, Unifier

▶ Higher-Order Unification problem: a finite set of equations

$$\Gamma = \{s_1 \stackrel{.}{=}^? t_1, \ldots, s_n \stackrel{.}{=}^? t_n\},\$$

where  $s_i$ ,  $t_i$  are  $\lambda$ -terms.

▶ Unifier of Γ: a substitution  $\sigma$  such that  $s_i \sigma$  and  $t_i \sigma$  have the same normal form for each  $1 \le i \le n$ .

We will use capital letters to denote free variables in unification problems.

▶ 
$$\Gamma = \{F(f(a,b)) \stackrel{?}{=} f(F(a),b)\}.$$

- ►  $\Gamma = \{F(f(a,b)) \stackrel{!}{=} {}^{?} f(F(a),b)\}.$
- ▶ Unifier:  $\sigma_1 = \{F \mapsto \lambda x.f(x,b)\}.$

- ►  $\Gamma = \{F(f(a,b)) \stackrel{?}{=} f(F(a),b)\}.$
- ▶ Unifier:  $\sigma_1 = \{F \mapsto \lambda x.f(x,b)\}.$
- ▶ Justification:

$$F(f(a,b))\sigma_1 = ((\lambda x.f(x,b)) f(a,b)) \rhd_{\beta} f(f(a,b),b).$$

- ►  $\Gamma = \{F(f(a,b)) \stackrel{:}{=}^? f(F(a),b)\}.$
- ▶ Unifier:  $\sigma_1 = \{F \mapsto \lambda x. f(x, b)\}.$
- ▶ Justification:

$$F(f(a,b))\sigma_1 = ((\lambda x.f(x,b)) f(a,b)) \rhd_{\beta} f(f(a,b),b).$$
  
$$f(F(a),b)\sigma_1 = f(((\lambda x.f(x,b)) a),b) \rhd_{\beta} f(f(a,b),b).$$

▶ 
$$\Gamma = \{F(f(a,b)) \stackrel{?}{=} f(F(a),b)\}.$$

- ►  $\Gamma = \{F(f(a,b)) \stackrel{!}{=} {}^{?} f(F(a),b)\}.$
- ▶ Another unifier:  $\sigma_2 = \{F \mapsto \lambda x. f(f(x,b),b)\}.$

- ►  $\Gamma = \{F(f(a,b)) \stackrel{:}{=}^? f(F(a),b)\}.$
- ▶ Another unifier:  $\sigma_2 = \{F \mapsto \lambda x. f(f(x, b), b)\}.$
- ▶ Justification:

$$F(f(a,b))\sigma_2 = ((\lambda x.f(f(x,b),b)) f(a,b)) \rhd_{\beta} f(f(f(a,b),b),b).$$

- ►  $\Gamma = \{F(f(a,b)) \stackrel{:}{=}^? f(F(a),b)\}.$
- ▶ Another unifier:  $\sigma_2 = \{F \mapsto \lambda x. f(f(x, b), b)\}.$
- Justification:

$$F(f(a,b))\sigma_2 = ((\lambda x.f(f(x,b),b)) f(a,b)) \rhd_{\beta} f(f(f(a,b),b),b).$$
  
$$f(F(a),b)\sigma_2 = f(((\lambda x.f(f(x,b),b)) a),b) \rhd_{\beta} f(f(f(a,b),b),b).$$

▶ 
$$\Gamma = \{F(f(a,b)) \stackrel{?}{=} f(F(a),b)\}.$$

- ►  $\Gamma = \{F(f(a,b)) \stackrel{?}{=} f(F(a),b)\}.$
- ► Infinitely many unifiers, of the shape

$$\{F \mapsto \lambda x. \ f(\ldots f(x,b),\ldots b)\}.$$

#### Example

- ►  $\Gamma = \{F(f(a,b)) \stackrel{!}{=} {}^{?} f(F(a),b)\}.$
- Infinitely many unifiers, of the shape

$$\{F \mapsto \lambda x. \ f(\ldots f(x,b),\ldots b)\}.$$

► Incomparable wrt instantiation quasi-ordering.

- ►  $\Gamma = \{F(f(a,b)) \stackrel{!}{=} {}^{?} f(F(a),b)\}.$
- Infinitely many unifiers, of the shape

$$\{F \mapsto \lambda x. \ f(\ldots f(x,b),\ldots b)\}.$$

- ▶ Incomparable wrt instantiation quasi-ordering.
- Minimal complete set of unifiers.

- ►  $\Gamma = \{F(f(a,b)) \stackrel{!}{=} {}^{?} f(F(a),b)\}.$
- ► Infinitely many unifiers, of the shape

$$\{F \mapsto \lambda x. \ f(\ldots f(x,b),\ldots b)\}.$$

- ► Incomparable wrt instantiation quasi-ordering.
- Minimal complete set of unifiers.
- ▶ There are problems for which this set does not exist!

▶ Unification problem:  $\Gamma = \{F(\lambda x. G(x), a) \stackrel{?}{=} F(\lambda x. G(x), b)\}.$ 

- ▶ Unification problem:  $\Gamma = \{F(\lambda x. G(x), a) \stackrel{?}{=} F(\lambda x. G(x), b)\}.$
- ► Complete set of solutions (together with the instance terms):

- ▶ Unification problem:  $\Gamma = \{F(\lambda x. G(x), a) \stackrel{?}{=} F(\lambda x. G(x), b)\}.$
- ► Complete set of solutions (together with the instance terms):

$$\sigma = \{ F \mapsto \lambda x. \lambda y. \ H(x) \} \qquad H(\lambda x. \ G(x))$$

- ▶ Unification problem:  $\Gamma = \{F(\lambda x. G(x), a) \stackrel{?}{=}^? F(\lambda x. G(x), b)\}.$
- ► Complete set of solutions (together with the instance terms):

$$\sigma = \{ F \mapsto \lambda x. \lambda y. \ H(x) \} \qquad H(\lambda x. \ G(x))$$
  
$$\sigma_0 = \{ F \mapsto \lambda x. \ x, G \mapsto \lambda x. \ Y \} \qquad Y$$

- ▶ Unification problem:  $\Gamma = \{F(\lambda x. G(x), a) \stackrel{?}{=}^? F(\lambda x. G(x), b)\}.$
- ► Complete set of solutions (together with the instance terms):

$$\sigma = \{F \mapsto \lambda x. \lambda y. \ H(x)\} \qquad H(\lambda x. \ G(x))$$

$$\sigma_0 = \{F \mapsto \lambda x. \ x, \ G \mapsto \lambda x. \ Y\} \qquad Y$$

$$\sigma_1 = \{F \mapsto \lambda x. \lambda y. \ G_1(x, x(H_1^1(x, y))), \ G \mapsto \lambda x. \ Y\} \qquad G_1(\lambda x. \ Y, \ Y)$$

- ▶ Unification problem:  $\Gamma = \{F(\lambda x. G(x), a) \stackrel{?}{=}^? F(\lambda x. G(x), b)\}.$
- ► Complete set of solutions (together with the instance terms):

$$\sigma = \{F \mapsto \lambda x. \lambda y. \ H(x)\} \qquad H(\lambda x. \ G(x))$$

$$\sigma_0 = \{F \mapsto \lambda x. \ x, \ G \mapsto \lambda x. \ Y\} \qquad Y$$

$$\sigma_1 = \{F \mapsto \lambda x. \lambda y. \ G_1(x, x(H_1^1(x, y))), \ G \mapsto \lambda x. \ Y\} \qquad G_1(\lambda x. \ Y, \ Y)$$

$$\sigma_2 = \{F \mapsto \lambda x. \lambda y. \ G_2(x, x(H_1^2(x, y)), x(H_2^2(x, y))), \ G \mapsto \lambda x. \ Y\}$$

$$G_2(\lambda x. \ Y, \ Y, \ Y)$$

- ▶ Unification problem:  $\Gamma = \{F(\lambda x. G(x), a) \stackrel{?}{=}^? F(\lambda x. G(x), b)\}.$
- ► Complete set of solutions (together with the instance terms):

$$\sigma = \{F \mapsto \lambda x. \lambda y. \ H(x)\} \qquad H(\lambda x. \ G(x))$$

$$\sigma_0 = \{F \mapsto \lambda x. \ x, \ G \mapsto \lambda x. \ Y\} \qquad Y$$

$$\sigma_1 = \{F \mapsto \lambda x. \lambda y. \ G_1(x, x(H_1^1(x, y))), \ G \mapsto \lambda x. \ Y\} \qquad G_1(\lambda x. \ Y, \ Y)$$

$$\sigma_2 = \{F \mapsto \lambda x. \lambda y. \ G_2(x, x(H_1^2(x, y)), x(H_2^2(x, y))), \ G \mapsto \lambda x. \ Y\}$$

$$G_2(\lambda x. \ Y, \ Y, \ Y)$$

$$\dots$$

$$\sigma_n = \{F \mapsto \lambda x. \lambda y. \ G_n(x, x(H_1^n(x, y)), \dots, x(H_n^n(x, y))), \ G \mapsto \lambda x. \ Y\}$$

$$G_n(\lambda x. \ Y, \ Y, \dots, \ Y) \qquad (n \ Y's)$$

- ▶ Unification problem:  $\Gamma = \{F(\lambda x. G(x), a) \stackrel{?}{=} F(\lambda x. G(x), b)\}.$
- Complete set of solutions:

$$\sigma = \{F \mapsto \lambda x. \lambda y. \ H(x)\}$$

$$\sigma_0 = \{F \mapsto \lambda x. \ x, \ G \mapsto \lambda x. \ Y\}$$

$$\sigma_n = \{F \mapsto \lambda x. \lambda y. \ G_n(x, x(H_1^n(x, y)), \dots, x(H_n^n(x, y))), \ G \mapsto \lambda x. \ Y\}$$

- ▶ Unification problem:  $\Gamma = \{F(\lambda x. G(x), a) \stackrel{?}{=} F(\lambda x. G(x), b)\}.$
- Complete set of solutions:

$$\sigma = \{F \mapsto \lambda x. \lambda y. \ H(x)\}$$

$$\sigma_0 = \{F \mapsto \lambda x. \ x, G \mapsto \lambda x. \ Y\}$$

$$\sigma_n = \{F \mapsto \lambda x. \lambda y. \ G_n(x, x(H_1^n(x, y)), \dots, x(H_n^n(x, y))), G \mapsto \lambda x. \ Y\}$$

▶ No minimal complete set of unifiers. For all i,j > i:  $\sigma_i \not \leq^{\{F,G\}} \sigma_j$ ,  $\sigma \not \leq^{\{F,G\}} \sigma_i$ ,  $\sigma_i \not \leq^{\{F,G\}} \sigma$ , and  $\sigma_i = {^{F,G\}}\sigma_{i+1}\vartheta_i}$  where

$$\vartheta_i = \{G_{i+1} \mapsto \lambda x. \lambda y_1....\lambda y_{i+1}.G_i(x, y_1, ..., y_i), H_1^{i+1} \mapsto H_1^i, ..., H_i^{i+1} \mapsto H_i^i\}$$

- ▶ Unification problem:  $\Gamma = \{F(\lambda x. G(x), a) \stackrel{?}{=} F(\lambda x. G(x), b)\}.$
- Complete set of solutions:

$$\begin{split} \sigma &= \{ F \mapsto \lambda x. \lambda y. \ H(x) \} \\ \sigma_0 &= \{ F \mapsto \lambda x. \ x, \ G \mapsto \lambda x. \ Y \} \\ \sigma_n &= \{ F \mapsto \lambda x. \lambda y. \ G_n(x, x(H_1^n(x,y)), \dots, x(H_n^n(x,y))), \ G \mapsto \lambda x. \ Y \} \end{split}$$

▶ No minimal complete set of unifiers. For all i,j > i:  $\sigma_i \not \leq^{\{F,G\}} \sigma_j$ ,  $\sigma \not \leq^{\{F,G\}} \sigma_i$ ,  $\sigma_i \not \leq^{\{F,G\}} \sigma$ , and  $\sigma_i = {^{F,G\}}\sigma_{i+1}\vartheta_i}$  where

$$\vartheta_i = \{G_{i+1} \mapsto \lambda x. \lambda y_1....\lambda y_{i+1}.G_i(x, y_1, ..., y_i), H_1^{i+1} \mapsto H_1^i, ..., H_i^{i+1} \mapsto H_i^i\}$$

▶ Infinite descending chain:  $\sigma_0 > ^{\{F,G\}} \sigma_1 > ^{\{F,G\}} \sigma_2 > ^{\{F,G\}} \cdots$ 

▶ Unification problem:  $\Gamma = \{F(\lambda x. G(x), a) \stackrel{?}{=} F(\lambda x. G(x), b)\}.$ 

- ▶ Unification problem:  $\Gamma = \{F(\lambda x. G(x), a) \stackrel{?}{=} F(\lambda x. G(x), b)\}.$
- ▶ The problem is of third order.

- ▶ Unification problem:  $\Gamma = \{F(\lambda x. G(x), a) \stackrel{?}{=} F(\lambda x. G(x), b)\}.$
- ► The problem is of third order.
- ▶ Higher-order unification of the order 3 and above is of type 0.

- ▶ Unification problem:  $\Gamma = \{F(\lambda x. G(x), a) \stackrel{?}{=} F(\lambda x. G(x), b)\}.$
- ► The problem is of third order.
- ▶ Higher-order unification of the order 3 and above is of type 0.
- Second order unification is infinitary.

- Idea: Reduce Hilbert's 10th problem to a higher-order unification problem.
- ▶ Hilbert's 10th problem is undecidable: There is no algorithm that takes as input two polynomials  $P(X_1, ..., X_n)$  and  $Q(X_1, ..., X_n)$  with natural coefficients and answers if there exist natural numbers  $m_1, ..., m_n$  such that

$$P(m_1,\ldots,m_n)=Q(m_1,\ldots,m_n).$$

- Reduction requires to represent
  - natural numbers,
  - addition,
  - multiplication

in terms of higher-order unification.

#### Representation (Goldfarb 1981):

▶ Natural number *n* represented as a  $\lambda$ -term denoted by  $\overline{n}$ :

$$\lambda x.g(a,g(a,\ldots g(a,x)\ldots))$$

with *n* occurrences of *g* and *a*. The type of *g* is  $i \rightarrow i \rightarrow i$  and the type of *a* is *i*. Such terms are called Goldfarb numbers.

 Goldfarb numbers are exactly those that solve the unification problem

$$\{g(a, X(a)) \stackrel{?}{=} X(g(a, a))\}$$

and have the type  $i \rightarrow i$ .

#### Representation:

▶ Addition is represented by the  $\lambda$ -term *add*:

$$\lambda n.\lambda m.\lambda x. \ n(m(x)).$$

 Multiplication is represented by the higher-order unification problem

$$\{ Y(a,b,g(g(X_3(a),X_2(b)),a)) \stackrel{?}{=} g(g(a,b),Y(X_1(a),g(a,b),a))$$

$$Y(b,a,g(g(X_3(b),X_2(a)),a)) \stackrel{?}{=} g(g(b,a),Y(X_1(b),g(a,a),a)) \}$$

that has a solution  $\{X_1 \mapsto \overline{m_1}, X_2 \mapsto \overline{m_2}, X_3 \mapsto \overline{m_3}, Y \mapsto t\}$  iff  $m_1 \times m_2 = m_3$ .

#### Reduction from Hilbert's 10th problem:

▶ Every equation  $P(X_1,...,X_n) = Q(X_1,...,X_n)$  can be decomposed into a system of equations of the form:

$$X_i + X_j = X_k$$
,  $X_i \times X_j = X_k$ ,  $X_i = m$ .

- With each such system associate a unification problem containing
  - ▶ for each  $X_i$  an equation  $g(a, X_i(a)) \stackrel{?}{=} X_i(g(a, a))$ ,
  - ▶ for each  $X_i + X_j = X_k$  the equation  $add(X_i, X_j) \stackrel{?}{=} X_k$ ,
  - for each  $X_i \times X_j = X_k$  the two equations used to define multiplication,
  - for each  $X_i = m$  the equation  $X_i \stackrel{?}{=} \overline{m}$ .

#### Second Order Unification Is Undecidable

- The reduction implies undecidability of higher-order unification.
- Since the reduction is actually to second-order unification, the result is sharper:

#### **Theorem**

Second-order unification is undecidable.

For the details of undecidability of second-order unification, see

W. D. Goldfarb

The undecidability of the second-order unification problem. Theoretical Computer Science **13**, 225–230.

▶ Higher-order semi-decision procedure is easy to design:

- Higher-order semi-decision procedure is easy to design:
  - 1. Enumerate all substitutions (in fact, it is enough to enumerate all closed substitutions).

- ▶ Higher-order semi-decision procedure is easy to design:
  - 1. Enumerate all substitutions (in fact, it is enough to enumerate all closed substitutions).
  - 2. For a given unification problem, take the first untried substitution and check whether it is a solution.

- ▶ Higher-order semi-decision procedure is easy to design:
  - 1. Enumerate all substitutions (in fact, it is enough to enumerate all closed substitutions).
  - 2. For a given unification problem, take the first untried substitution and check whether it is a solution.
  - 3. If yes, stop with success. If not, mark the substitution as tried and iterate.

- ▶ Higher-order semi-decision procedure is easy to design:
  - 1. Enumerate all substitutions (in fact, it is enough to enumerate all closed substitutions).
  - 2. For a given unification problem, take the first untried substitution and check whether it is a solution.
  - 3. If yes, stop with success. If not, mark the substitution as tried and iterate.
- ► Checking is not hard: Apply the substitution to both sides of each equation, normalize, and compare the normal forms.

- ▶ Higher-order semi-decision procedure is easy to design:

- Checking is not hard: Apply the substitution to both sides of each equation, normalize, and compare the normal forms.
- If the problem is solvable, the procedure will detect it after finite steps.
- ► Then... why to bother with looking for another unification procedure?

Why to look for a "better" procedure?

Why to look for a "better" procedure?

► To find solutions faster.

Why to look for a "better" procedure?

- ▶ To find solutions faster.
- ▶ To report failure for many unsolvable cases.

Why to look for a "better" procedure?

- To find solutions faster.
- To report failure for many unsolvable cases.
- To reduce redundancy.
- etc.

- System: a pair P;  $\sigma$ , where P is a higher-order unification problem and  $\sigma$  is a substitution.
- Procedure is given by transformation rules on systems.
- ► The description essentially follows the paper
  - W. Snyder and J. Gallier.

Higher-Order Unification Revisited: Complete Sets of Transformations.

*J. Symbolic Computation*, **8**(1–2), 101–140, 1989.

Flex-flex equation has a form

$$\lambda x_1 \ldots \lambda x_k$$
.  $F(s_1, \ldots, s_n) \stackrel{?}{=} \lambda x_1 \ldots \lambda x_k$ .  $G(t_1, \ldots, t_m)$ .

The head of both sides are free variables.

Flex-flex equation has a form

$$\lambda x_1 \ldots \lambda x_k$$
.  $F(s_1, \ldots, s_n) \stackrel{?}{=} \lambda x_1 \ldots \lambda x_k$ .  $G(t_1, \ldots, t_m)$ .

The head of both sides are free variables.

Any flex-flex equation is solvable. Just take

$$\{ \textbf{\textit{F}} \mapsto \lambda \textbf{\textit{y}}_1.\dots\lambda \textbf{\textit{y}}_m. \ \textbf{\textit{c}}, \ \ \textbf{\textit{G}} \mapsto \lambda \textbf{\textit{y}}_1.\dots\lambda \textbf{\textit{y}}_m. \ \textbf{\textit{c}} \}.$$

Flex-flex equation has a form

$$\lambda x_1 \ldots \lambda x_k$$
.  $F(s_1, \ldots, s_n) \stackrel{?}{=} \lambda x_1 \ldots \lambda x_k$ .  $G(t_1, \ldots, t_m)$ .

The head of both sides are free variables.

Any flex-flex equation is solvable. Just take

$$\{F \mapsto \lambda y_1 \dots \lambda y_n. \ c, \ G \mapsto \lambda y_1 \dots \lambda y_m. \ c\}.$$

► The appropriate *c* always exists because for each type we have at least one constant of that type.

Flex-flex equation has a form

$$\lambda x_1 \ldots \lambda x_k$$
.  $F(s_1, \ldots, s_n) \stackrel{?}{=} \lambda x_1 \ldots \lambda x_k$ .  $G(t_1, \ldots, t_m)$ .

The head of both sides are free variables.

Any flex-flex equation is solvable. Just take

$$\{F \mapsto \lambda y_1 \dots \lambda y_n. \ c, \ G \mapsto \lambda y_1 \dots \lambda y_m. \ c\}.$$

- ▶ The appropriate *c* always exists because for each type we have at least one constant of that type.
- ► Flex-flex equations may introduce infinite branching in the search tree (very undesirable property).

Flex-flex equation has a form

$$\lambda x_1 \ldots \lambda x_k$$
.  $F(s_1, \ldots, s_n) \stackrel{?}{=} \lambda x_1 \ldots \lambda x_k$ .  $G(t_1, \ldots, t_m)$ .

The head of both sides are free variables.

Any flex-flex equation is solvable. Just take

$$\{F \mapsto \lambda y_1 \dots \lambda y_n. \ c, \ G \mapsto \lambda y_1 \dots \lambda y_m. \ c\}.$$

- ▶ The appropriate *c* always exists because for each type we have at least one constant of that type.
- ► Flex-flex equations may introduce infinite branching in the search tree (very undesirable property).
- ► Idea: Do not try to solve flex-flex equations. Assume them solved. Preunification.

## Preunification

### Preunifier

- Let 

  be the least congruence relation on the set of 

  λ-terms that contains the set of flex-flex pairs.
- A substitution  $\sigma$  is a preunifier for a unification problem  $\{s_1 \stackrel{?}{=} t_1, \dots, s_n \stackrel{?}{=} t_n\}$  iff

$$normal-form(s_i\sigma) \cong normal-form(t_i\sigma)$$

for each  $1 \le i \le n$ .

### Convention

- $ightharpoonup \overline{x_n}$  abbreviates  $x_1, \ldots, x_n$ .
- $\rightarrow \lambda \overline{x_n}$  abbreviates  $\lambda x_1 \dots \lambda x_n$ .

## Partial Binding

A partial binding of type  $T_1 \rightarrow \cdots \rightarrow T_n \rightarrow U$  (U atomic) is a term of the form

$$\lambda \overline{x_n}$$
.  $I(\lambda \overline{y_{m_1}^1}.H_1(\overline{x_n},\overline{y_{m_1}^1}),\ldots,\lambda \overline{y_{m_k}^k}.H_k((\overline{x_n},\overline{y_{m_k}^k}))$ 

## Partial Binding

A partial binding of type  $T_1 \rightarrow \cdots \rightarrow T_n \rightarrow U$  (U atomic) is a term of the form

$$\lambda \overline{x_n}$$
.  $I(\lambda \overline{y_{m_1}^1}.H_1(\overline{x_n},\overline{y_{m_1}^1}),\ldots,\lambda \overline{y_{m_k}^k}.H_k((\overline{x_n},\overline{y_{m_k}^k}))$ 

where I is a constant or a variable, and

▶ the type of  $x_i$  is  $T_i$  for  $1 \le i \le n$ ,

## Partial Binding

A partial binding of type  $T_1 \rightarrow \cdots \rightarrow T_n \rightarrow U$  (*U* atomic) is a term of the form

$$\lambda \overline{x_n}$$
.  $I(\lambda \overline{y_{m_1}^1}.H_1(\overline{x_n},\overline{y_{m_1}^1}),\ldots,\lambda \overline{y_{m_k}^k}.H_k((\overline{x_n},\overline{y_{m_k}^k}))$ 

- ▶ the type of  $x_i$  is  $T_i$  for  $1 \le i \le n$ ,
- ▶ the type of I is  $S_1 \to \cdots \to S_k \to U$ , where  $S_i$  is  $R_i^1 \to \cdots \to R_{m_i}^i \to S_i'$  ( $S_i'$  atomic) for  $1 \le i \le k$ ,

## Partial Binding

A partial binding of type  $T_1 \rightarrow \cdots \rightarrow T_n \rightarrow U$  (*U* atomic) is a term of the form

$$\lambda \overline{x_n}$$
.  $I(\lambda \overline{y_{m_1}^1}.H_1(\overline{x_n},\overline{y_{m_1}^1}),\ldots,\lambda \overline{y_{m_k}^k}.H_k((\overline{x_n},\overline{y_{m_k}^k}))$ 

- ▶ the type of  $x_i$  is  $T_i$  for  $1 \le i \le n$ ,
- ▶ the type of I is  $S_1 \to \cdots \to S_k \to U$ , where  $S_i$  is  $R_i^1 \to \cdots \to R_{m_i}^i \to S_i'$  ( $S_i'$  atomic) for  $1 \le i \le k$ ,
- ▶ the type of  $y_j^i$  is  $R_j^i$  for  $1 \le i \le k$  and  $1 \le j \le m_i$ .

## Partial Binding

A partial binding of type  $T_1 \rightarrow \cdots \rightarrow T_n \rightarrow U$  (U atomic) is a term of the form

$$\lambda \overline{x_n}$$
.  $I(\lambda \overline{y_{m_1}^1}.H_1(\overline{x_n},\overline{y_{m_1}^1}),\ldots,\lambda \overline{y_{m_k}^k}.H_k((\overline{x_n},\overline{y_{m_k}^k}))$ 

- ▶ the type of  $x_i$  is  $T_i$  for  $1 \le i \le n$ ,
- ▶ the type of I is  $S_1 \to \cdots \to S_k \to U$ , where  $S_i$  is  $R_i^1 \to \cdots \to R_{m_i}^i \to S_i'$  ( $S_i'$  atomic) for  $1 \le i \le k$ ,
- ▶ the type of  $y_j^i$  is  $R_j^i$  for  $1 \le i \le k$  and  $1 \le j \le m_i$ .
- ▶ the type of  $H_i$  is  $T_1 \to \cdots \to T_n \to R_1^i \to \cdots \to R_{m_i}^i \to S_i^i$  for  $1 \le i \le k$ .

# Partial Binding

$$\lambda \overline{x_n}$$
.  $I(\lambda \overline{y_{m_1}^1}.H_1(\overline{x_n},\overline{y_{m_1}^1}),\ldots,\lambda \overline{y_{m_k}^k}.H_k((\overline{x_n},\overline{y_{m_k}^k}))$ 

- ▶ Imitation binding: *I* is a constant or a free variable.
- (i<sup>th</sup>) Projection binding: I is  $x_i$ .
- ▶ A partial binding t is appropriate to F if t and F have the same types.
- F → t: Appropriate partial (imitation, projection) binding if t is partial (imitation, projection) binding appropriate to F.

- ▶ The inference system  $\mathcal{U}_{HOP}$  consists of the rules:
  - Trivial
  - Decomposition
  - Variable Elimination
  - Orient
  - Imitation
  - Projection
- ► The rules transform systems: pairs  $\Gamma$ ;  $\sigma$ , where  $\Gamma$  is a higher-order unification problem and  $\sigma$  is a substitution.
- A system Γ; σ is in presolved form if Γ is either empty or consists of flex-flex equations only.

**Trivial:** 
$$\{t \stackrel{?}{=} t\} \cup P'; \vartheta \Longrightarrow P'; \vartheta$$

**Trivial:** 
$$\{t \stackrel{?}{=} t\} \cup P'; \vartheta \Longrightarrow P'; \vartheta$$

### **Decomposition:**

$$\{\lambda \overline{X_k}. \ I(s_1, \ldots, s_n) \stackrel{?}{=} {}^? \lambda \overline{X_k}. \ I(t_1, \ldots, t_n)\} \cup P'; \vartheta \Longrightarrow$$

$$\{\lambda \overline{X_k}. \ s_1 \stackrel{?}{=} {}^? \lambda \overline{X_k}. \ t_1, \ldots, \lambda \overline{X_k}. \ s_n \stackrel{?}{=} {}^? \lambda \overline{X_k}. \ t_n, \} \cup P'; \vartheta.$$

where I is either a constant or one of the bound variables  $x_1, \ldots, x_k$ .

**Trivial:**  $\{t \stackrel{?}{=} t\} \cup P'; \vartheta \Longrightarrow P'; \vartheta$ 

### **Decomposition:**

$$\{\lambda \overline{X_k}. \ I(s_1, \ldots, s_n) \stackrel{?}{=} {}^? \lambda \overline{X_k}. \ I(t_1, \ldots, t_n)\} \cup P'; \vartheta \Longrightarrow$$

$$\{\lambda \overline{X_k}. \ s_1 \stackrel{?}{=} {}^? \lambda \overline{X_k}. \ t_1, \ldots, \lambda \overline{X_k}. \ s_n \stackrel{?}{=} {}^? \lambda \overline{X_k}. \ t_n, \} \cup P'; \vartheta.$$

where *I* is either a constant or one of the bound variables  $x_1, \ldots, x_k$ .

### Variable Elimination:

$$\{\lambda x_1.\dots\lambda x_k.\ F(x_1,\dots,x_k)\stackrel{?}{=}{}^?\ t\}\cup P'; \vartheta\Longrightarrow P'\{F\mapsto t\}; \vartheta\{F\mapsto t\}.$$

If  $F \notin fvars(t)$ 

#### Orient:

$$\{\lambda \overline{X_k}. \ I(t_1, \ldots, t_m) \stackrel{?}{=} {}^? \lambda \overline{X_k}. \ F(s_1, \ldots, s_n)\} \cup P'; \vartheta \Longrightarrow \{\lambda \overline{X_k}. \ F(s_1, \ldots, s_n) \stackrel{?}{=} {}^? \lambda \overline{X_k}. \ I(t_1, \ldots, t_m)\} \cup P'; \vartheta$$

where I is not a free variable.

#### **Orient:**

$$\{\lambda \overline{X_k}. \ I(t_1, \ldots, t_m) \stackrel{?}{=} \lambda \overline{X_k}. \ F(s_1, \ldots, s_n)\} \cup P'; \vartheta \Longrightarrow \{\lambda \overline{X_k}. \ F(s_1, \ldots, s_n) \stackrel{?}{=} \lambda \overline{X_k}. \ I(t_1, \ldots, t_m)\} \cup P'; \vartheta$$

where I is not a free variable.

### Imitation:

$$\{\lambda \overline{X_k}. \ F(s_1, \ldots, s_n) \stackrel{:}{=} {}^? \lambda \overline{X_k}. \ f(t_1, \ldots, t_m)\} \cup P'; \vartheta \Longrightarrow$$

$$\{\lambda \overline{X_k}. \ f(\lambda \overline{Z_{r_1}^1}. \ H_1(s_1, \ldots, s_n, \overline{Z_{r_n}^1}), \ldots, \lambda \overline{Z_{r_m}^m}. \ H_m(s_1, \ldots, s_n, \overline{Z_{r_m}^m})) \sigma$$

$$\stackrel{:}{=} {}^? \lambda \overline{X_k}. \ f(t_1, \ldots, t_m) \sigma\} \cup P' \sigma; \vartheta \sigma$$

#### where

- ▶  $\sigma = \{F \mapsto \lambda \overline{y_n}. \ f(\lambda \overline{z_{r_1}^1}. \ H_1(\overline{y_n}, \overline{z_{r_1}^1}), \dots, \lambda \overline{z_{r_m}^m}. \ H_m(\overline{y_n}, \overline{z_{r_m}^m}))\},$  appropriate imitation binding.
- $ightharpoonup H_1, \ldots, H_m$  are fresh variables.

### Projection:

$$\{\lambda \overline{X_k}. \ F(s_1, \ldots, s_n) \stackrel{?}{=} {}^? \lambda \overline{X_k}. \ I(t_1, \ldots, t_m)\} \cup P'; \vartheta \Longrightarrow$$

$$\{\lambda \overline{X_k}. \ s_i(\lambda \overline{Z_{r_1}^1}. \ H_1(s_1, \ldots, s_n, \overline{Z_{r_1}^n}), \ldots, \lambda \overline{Z_{r_m}^m}. \ H_m(s_1, \ldots, s_n, \overline{Z_{r_m}^m}))\sigma$$

$$\stackrel{?}{=} {}^? \lambda \overline{X_k}. \ I(t_1, \ldots, t_m)\sigma\} \cup P'\sigma; \vartheta\sigma$$

#### where

- ▶ I is either a constant or one of the bound variables  $x_1, \ldots, x_k$
- $\sigma = \{F \mapsto \lambda \overline{y_n}. \ y_i(\lambda \overline{z_{r_1}^1}. \ H_1(\overline{y_n}, \overline{z_{r_1}^1}), \dots, \lambda \overline{z_{r_m}^m}. \ H_m(\overline{y_n}, \overline{z_{r_m}^m}))\},$  appropriate projection binding.
- $\vdash H_1, \ldots, H_m$  are fresh variables.

In order to solve a higher-order unification problem  $\Gamma$ :

**Create an initial system**  $\Gamma$ ;  $\varepsilon$ .

- **Create an initial system**  $\Gamma$ ;  $\varepsilon$ .
- Apply successively rules from U<sub>HOP</sub>, building a complete (finitely branching, but potentially infinite) tree of derivations.

- **Create an initial system**  $\Gamma$ ;  $\varepsilon$ .
- Apply successively rules from \( \mathcal{U}\_{HOP} \), building a complete (finitely branching, but potentially infinite) tree of derivations.
- ▶ If no rule can be applied to a node, and it contains at least one equation that is not flex-flex, then extend the branch with  $\bot$ , indicating failure.

- **Create an initial system**  $\Gamma$ ;  $\varepsilon$ .
- Apply successively rules from \( \mathcal{U}\_{HOP} \), building a complete (finitely branching, but potentially infinite) tree of derivations.
- If no rule can be applied to a node, and it contains at least one equation that is not flex-flex, then extend the branch with ⊥, indicating failure.
- Successful leaves contain presolved systems.

- **Create an initial system**  $\Gamma$ ;  $\varepsilon$ .
- Apply successively rules from \( \mathcal{U}\_{HOP} \), building a complete (finitely branching, but potentially infinite) tree of derivations.
- If no rule can be applied to a node, and it contains at least one equation that is not flex-flex, then extend the branch with ⊥, indicating failure.
- Successful leaves contain presolved systems.
- If Δ; σ is a successful leaf, σ is a solution of Γ computed by the higher-order preunification procedure.

### Higher-Order Preunification. Major Results

#### Theorem (Soundness)

If  $\Gamma$ ;  $\varepsilon \Longrightarrow^* \Delta$ ;  $\sigma$  and  $\Delta$  is in presolved form, then  $\sigma|_{\text{fvars}(\Gamma)}$  is a preunifier of  $\Gamma$ .

### Theorem (Completeness)

If  $\vartheta$  is a preunifier of  $\Gamma$ , then there exists a sequence of transformations  $\Gamma$ ;  $\varepsilon \Longrightarrow^* \Delta$ ;  $\sigma$  such that  $\Delta$  is in presolved form, and  $\sigma \leq_{\beta}^{\text{fvars}(\Gamma)} \vartheta$ .

### Higher-Order Preunification. Optimization

- The procedure can be optimized by stripping off the binder λx when x does not occur in the body.
- For instance, Elimination rule does not apply to  $\lambda x.\lambda y. P(x) \stackrel{?}{=} \lambda x.\lambda y. f(a)$
- ▶ After removing  $\lambda y$  from both sides, Elimination can be applied directly.

- ▶ Unification problem  $\{F(f(a)) \stackrel{?}{=} f(F(a))\}.$

Flow flow

Flex-flex.

#### **Decidable Subcases**

#### Some decidable subcases of higher-order unification:

Monadic second-order unification. Terms do not contain constants of arity greater than 1. Example:  $\{\lambda x.f(F(x)) \stackrel{?}{=} \lambda x.F(f(x))\}.$ 

- Second-order unification with linear occurrences of second-order variables.
- ▶ Unification with higher-order patterns. Pattern is a term t such that for every subterm of the form  $F(s_1, ..., s_n)$ , the s's are distinct variables bound in t. Example:  $\{\lambda x. \lambda y. F(x) \stackrel{?}{=} \lambda x. \lambda y. c(G(y, x))\}$ .
- Higher-order matching. One side in the equations is a closed term.
  - Example.  $\{\lambda x. F(x, \lambda y. y) \stackrel{?}{=}^? \lambda x. f(x, a)\}.$
- Stratified second-order unification.
- Bounded second-order unification.
