Preliminaries

Abstract Interpreter

Choice Points

Term: Constant, variable, or compound term. Compound Term: Functor, arguments $f(t_1, \ldots, t_n)$ Functor: Name, arity f/nGoal: Atom or compound term. Clause: Universally quantified logical sentence $A \leftarrow B_1, \dots, B_k, k \ge 0$ A and B_i 's are goals.

Declarative reading: *A* is implied by the conjunction of the B_i 's. Procedural reading: To answer the query *A*, answer the conjunctive query B_1, \ldots, B_k .

Logic Program: Finite set of clauses.

Computation

Query: Existentially quantified conjunction $\leftarrow A_1, \dots, A_n, n > 0$ A_i 's are goals.

Computation of a Logic Program *P*: finds an instance of a given query logically deducible from *P*.

How to Compute

- ► Start from initial query G.
- ► Computation terminates success or failure.
- Computation does not terminate no result.
- Output of a successful computation: the instance of G proved.
- A given query can have several successful computations with different output.

INPUT:

A logic program *P* and a query *G*.

OUTPUT:

 $G\theta$, if this was the instance of G deduced from P, or *failure* if failure has occurred.

Abstract Interpreter

ALGORITHM:

Let *resolvent* be *G* While *resolvent* is not empty **do**

- 1. Choose a goal A from resolvent.
- 2. Choose a renamed clause $A' \leftarrow B_1, \ldots, B_n$ from *P* such that *A* and *A'* unify with an mgu θ (**exit** if no such goal and clause exist).
- 3. Remove A from and add B_1, \ldots, B_n to resolvent.
- 4. Apply θ to *resolvent* and to *G*.

If *resolvent* it empty, **return** G, else **return** failure.

Choosing and Adding:

- ► Left unspecified in the abstract interpreter.
- Must be resolved in a realization of the computational model.

Two Choices

Completely different nature. Choice of a goal:

- ► Arbitrary.
- Does not affect computation.
- If there exists a successful computation by choosing one goal, then there is a successful computation by choosing any other goal.

Choice of a clause:

- Non-deterministic.
- Affects computation.
- Choosing one clause might lead to success, while choosing some other might lead to failure.

- Assume: Always the leftmost goal to be chosen
 - Then: Adding new goal to the beginning of the resolvent gives depth-first search. Adding new goal to the end of the resolvent gives breadth-first search.

Prolog's Solution

- ► Choice of a goal: leftmost.
- ► Choice of a clause: Topmost.
- ► Adding new goal to the resolvent: At the beginning.
